

MOJO AI SUMMITS

Ideal Customer Profile

Database-wide sponsor and partner fit definition

Our ideal sponsor or partner is an AI-enabled B2B technology or services company that benefits from executive trust, has a credible reason to be in the AI transformation conversation, and wants access to senior enterprise buyers.

What We Mean By ICP

The ICP is not limited to AI startups. It includes established technology, security, IT, cloud, data, software, SaaS, automation, governance, and consulting companies whose buyers or customers are affected by enterprise AI adoption.

The common thread is strategic relevance: the company either sells into AI transformation, reduces AI-related risk, enables AI-ready infrastructure, or needs credibility with executives responsible for AI decisions.

Core ICP

Business type: B2B technology, security, IT, cloud, data, software, SaaS, automation, governance, or advisory/services company.

Executive audience: Needs access to CIOs, CISOs, CAIOs, CTOs, CEOs, COOs, data leaders, risk leaders, transformation leaders, or senior marketing/revenue/partner leaders.

AI relevance: Can credibly speak to AI readiness, AI security, AI governance, AI operations, AI adoption, data readiness, workflow automation, or platform decisions.

Commercial motion: Uses sponsorships, executive events, webinars, partner ecosystems, thought leadership, field marketing, or account-based marketing to create trusted demand.

Value of Mojo: Benefits from a small, high-trust executive audience more than a generic lead-list or mass-conference booth.

Best-Fit Company Categories

Cybersecurity vendors affected by AI risk, identity, privacy, governance, model abuse, threat detection, and CISO accountability.

Cloud, data, infrastructure, analytics, business intelligence, and platform companies enabling AI adoption.

Enterprise software and SaaS companies adding AI features or repositioning around AI-enabled workflow value.

IT services, MSPs, consulting firms, implementation partners, and transformation advisors helping customers adopt AI.

Governance, compliance, privacy, legal-tech, risk, audit, and control companies tied to responsible AI operations.

Automation, workflow, agent, developer-tool, and productivity platforms selling into AI-enabled operating models.

Strong Fit Signals

Sponsor intent: They sponsor AI, security, CIO, CISO, cloud, data, IT, SaaS, or executive leadership events.

Executive narrative: They can say something useful to senior leaders about AI strategy, risk, operations, workforce, platforms, or governance.

Budget alignment: Their buyers own transformation, security, data, software, infrastructure, risk, or operational excellence budgets.

Trust requirement: Their sale benefits from credibility, relationship-building, and senior-level context rather than simple product discovery.

Market maturity: They have marketing, partnerships, sales, field, alliance, or executive programs that can use a summit partnership.

Not Ideal, But Still Possible

Very small companies with no marketing or partnership budget.

Consumer AI apps with no enterprise executive buyer.

Agencies with no clear AI, governance, security, IT, or transformation point of view.

Companies selling only to developers with no executive narrative or budget-owner relevance.

Generic businesses that merely use AI internally but do not sell into the AI transformation market.

How To Use This In The Database

Core ICP: Prioritize first. These companies have strong category fit, AI relevance, executive audience overlap, and evidence of sponsor/marketing maturity.

Good ICP: Worth active review. They fit the market, but one signal may need verification, such as budget, sponsor history, or executive audience overlap.

Nurture ICP: Keep in the Vendor Universe. Revisit if new sponsor evidence, funding, event participation, or AI positioning appears.

Low Fit: Keep only as database context unless a human sees a specific strategic reason to pursue.

Plain-English Test

Would this company pay for trusted access to executives wrestling with AI strategy, risk, data, security, platforms, workforce, or operating model decisions? If yes, it belongs in the ICP conversation.
